

Next generation of hydrogen storage solutions based on innovative materials

MAST3RBoost Project – Carlos Sanchís ENVIROHEMP

November 9th, 2023

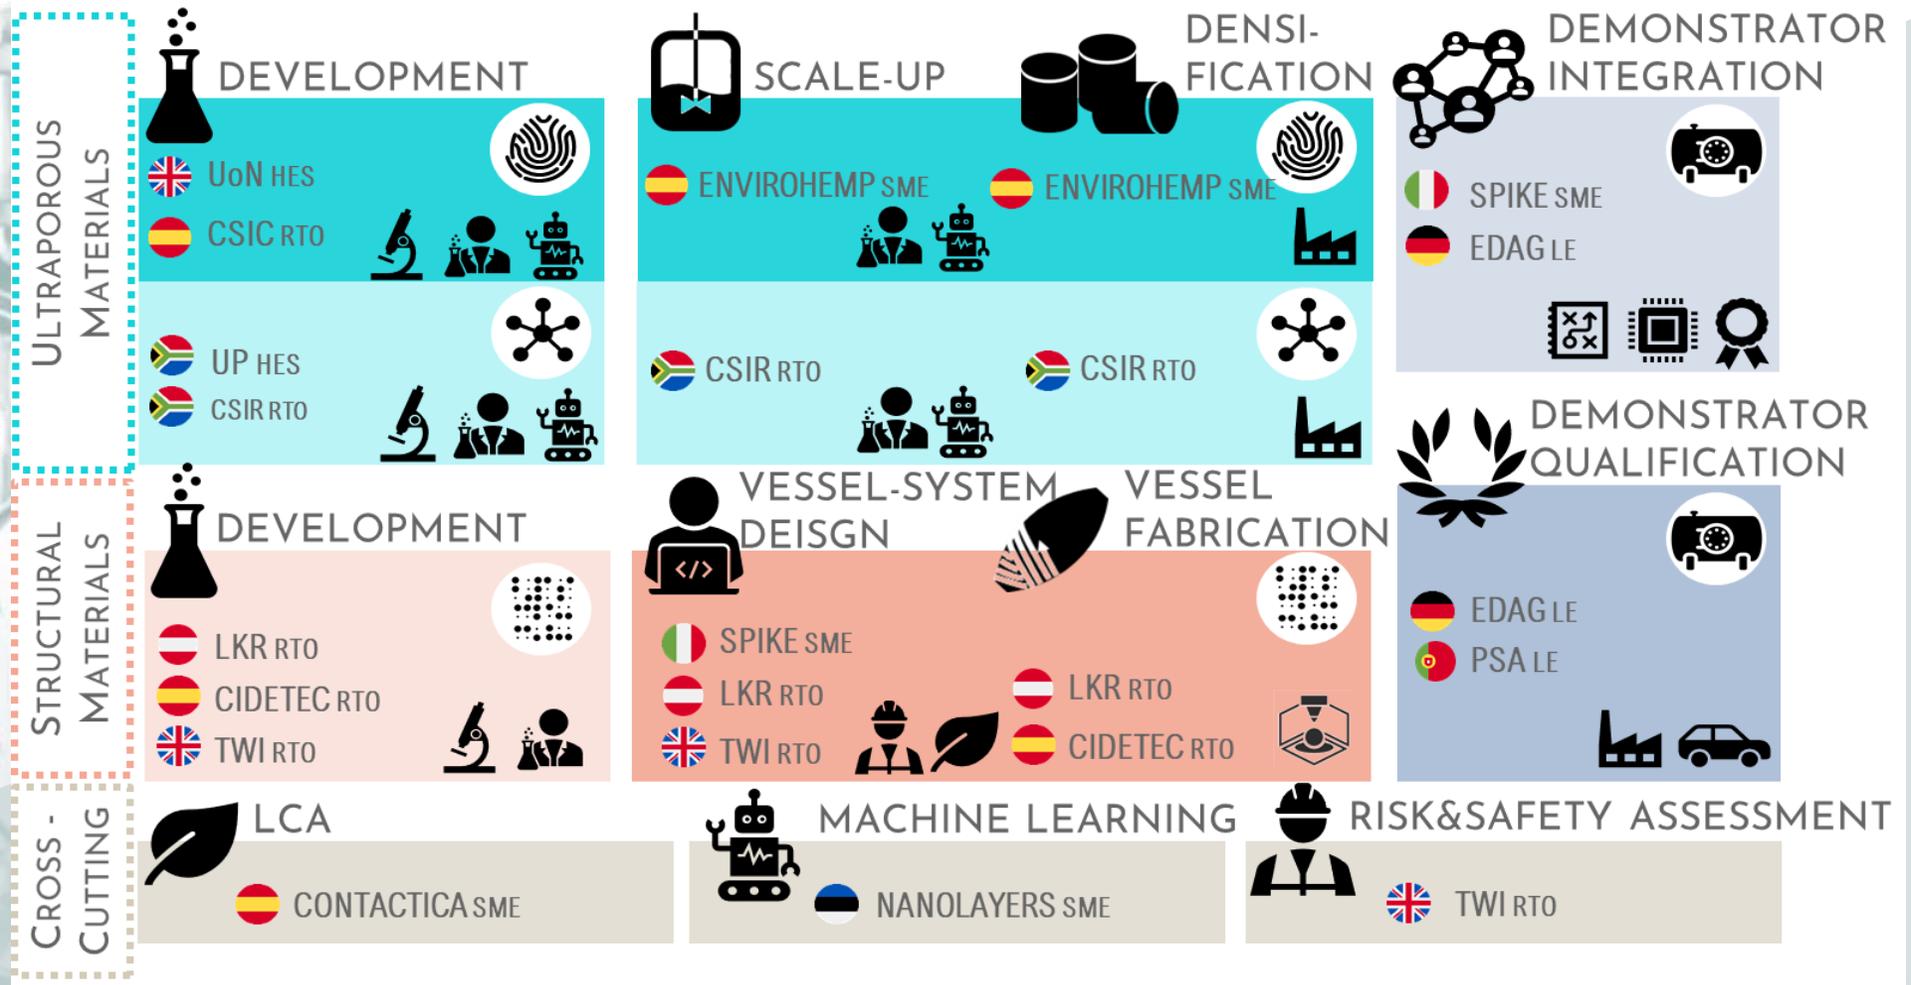

MAST3RBoost updates

1. Scope of the Project
2. Overview of Key Results Achieved and Future Milestones
3. Technical Challenges Encountered During Project Execution

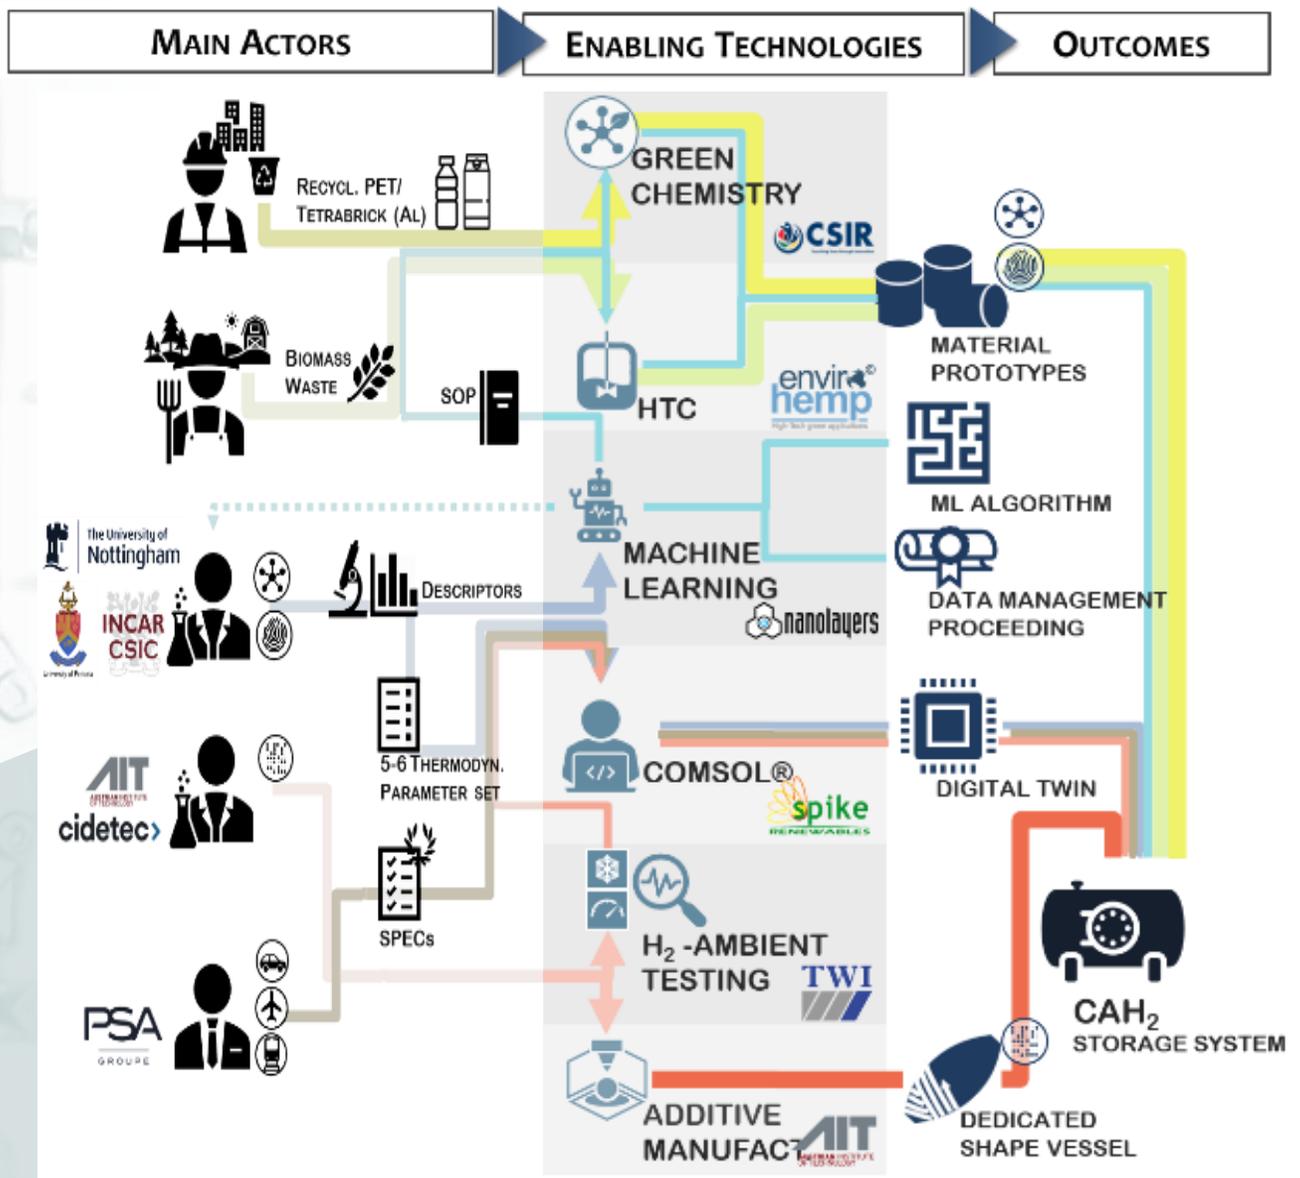

1. Scope of the Project

- The Concept
- The Technologies
- The Goals

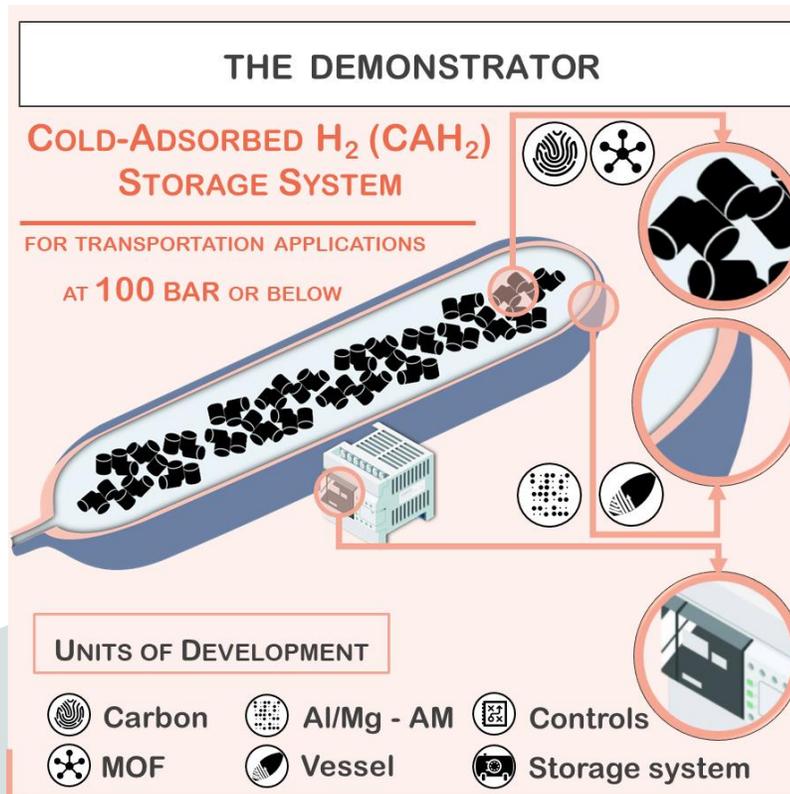

THE CONCEPT

THE TECHNOLOGIES

THE GOALS

>10 kg
densified
ultraporous
materials

20+ litre
scale
dedicated
vessel shape

Built-in active
temp.
swing
 $\Delta T > 80 \text{ K}$

1 kg
CAH₂
33 g/l_{sys}

2. Overview of Key Results Achieved and future Milestones

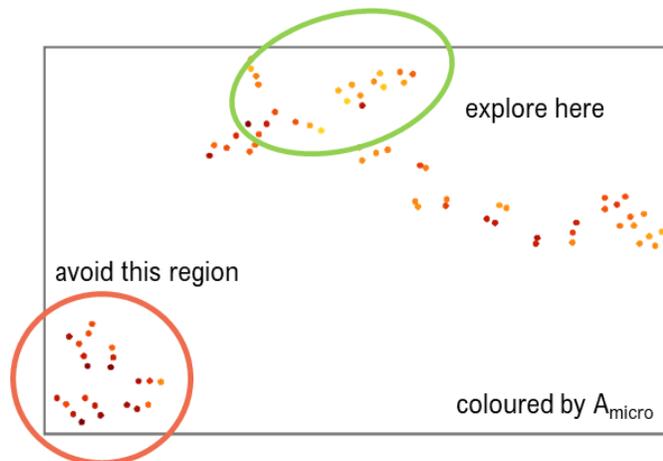

- Results on adsorbent materials
- Results on structural materials & system design
- Timeline of Milestones

Results on adsorbent materials

Machine Learning

- Preliminary database - ca. 180 AC materials
- Promising areas in 2D maps

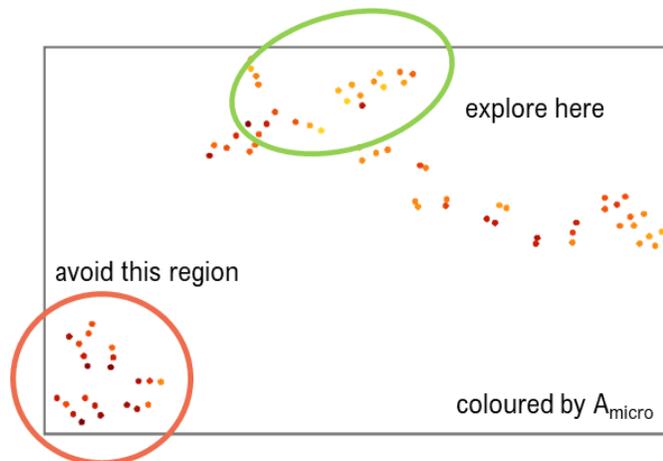

Results on adsorbent materials

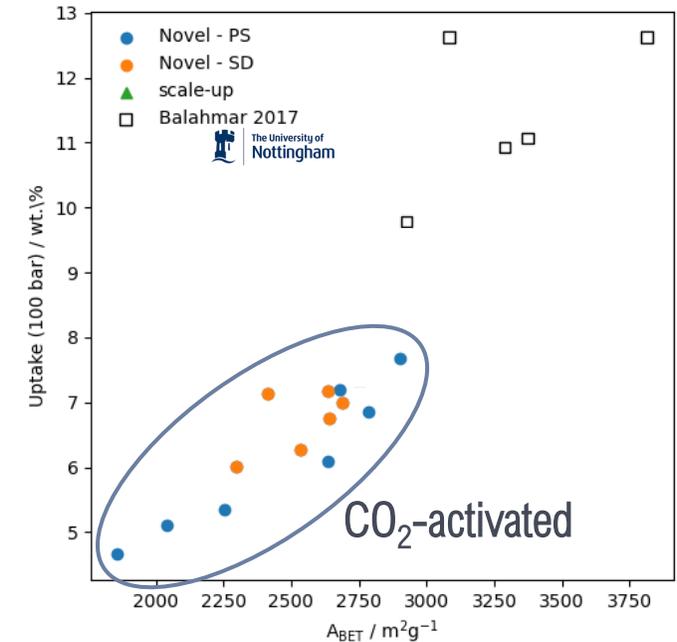

Machine Learning

- Preliminary database - ca. 180 AC materials
- Promising areas in 2D maps

Activated Carbons

- 50 new CO_2 -activated ACs
- 16 scale-up ACs (300 g) - 3 fully tested

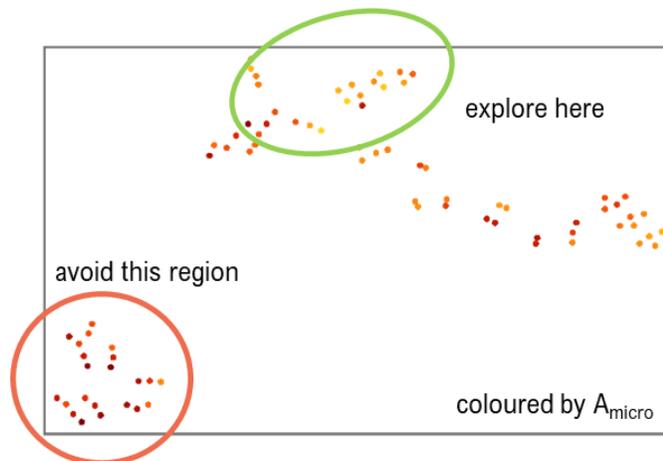

Results on adsorbent materials

Machine Learning

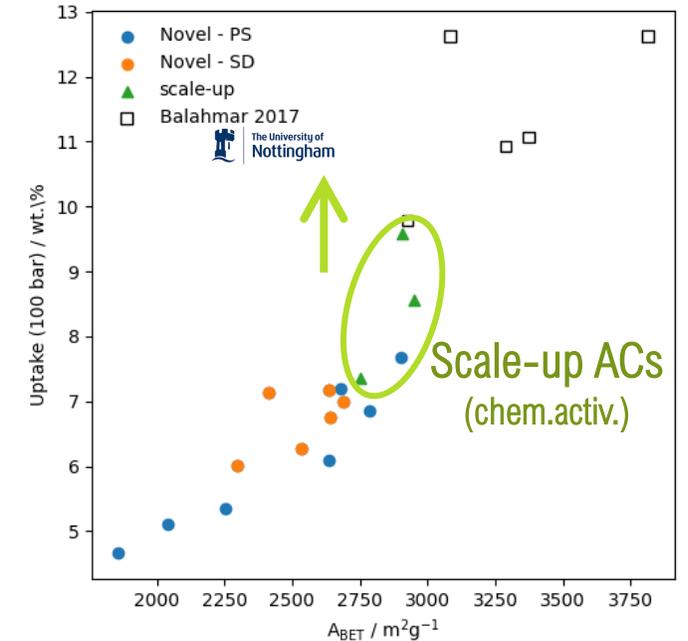

- Preliminary database - ca. 180 AC materials
- Promising areas in 2D maps

Activated Carbons

- 50 new CO_2 -activated ACs
- 16 scale-up ACs (300 g) - 3 fully tested

9.5 wt% H_2 uptake at 100 bar (77K)
for AC: 2910 m^2/g – 1.41 cm^3/g

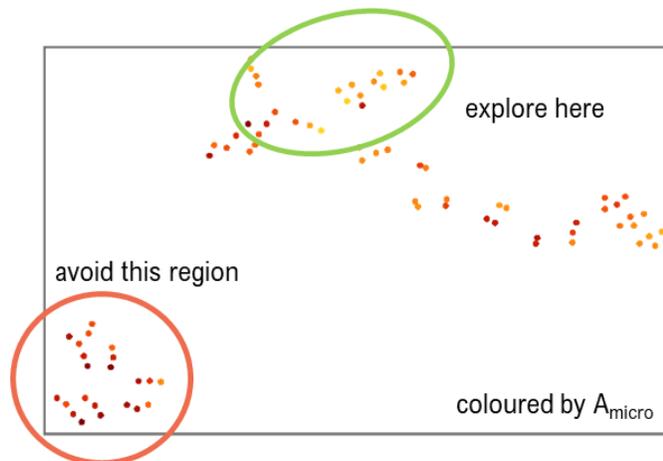

Results on adsorbent materials

Machine Learning

- Preliminary database - ca. 180 AC materials
- Promising areas in 2D maps

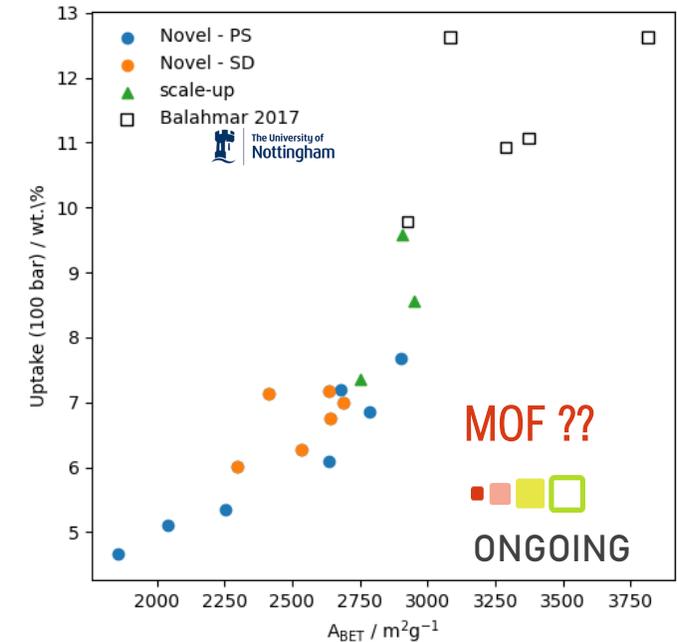

Activated Carbons

- 50 new CO_2 -activated ACs
- 16 scale-up ACs (300 g) - 3 fully tested

9.5 wt% H_2 uptake at 100 bar (77K)
for AC: 2910 m^2/g – 1.41 cm^3/g

MOFs

- 30 samples of Al-fumarate, MIL-88B, MIL-101
- Validating Acid Mine Drainage and waste polyAlu as metal source (Fe, Al)
- Systematic study of trace metals in synthesis of Fe-based MOF

Results on structural materials & system design

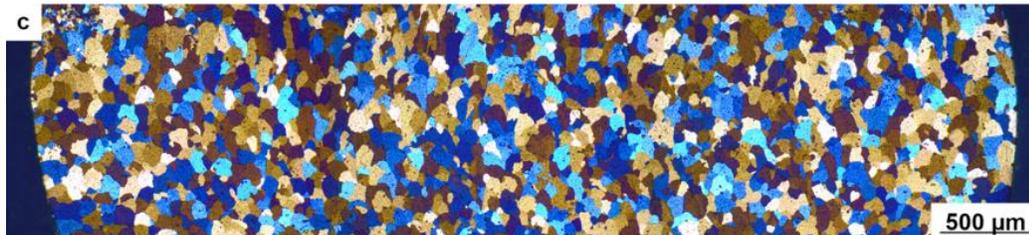

cidetec>

Wire Arc Additive Manufacturing

(Al alloy MA-5183)

- 20% increase in yield strength and slight increase in ductility at 77K
- Equiaxed grain morphology – Low porosity

- 2 commercial Coatings systems validated for 77K

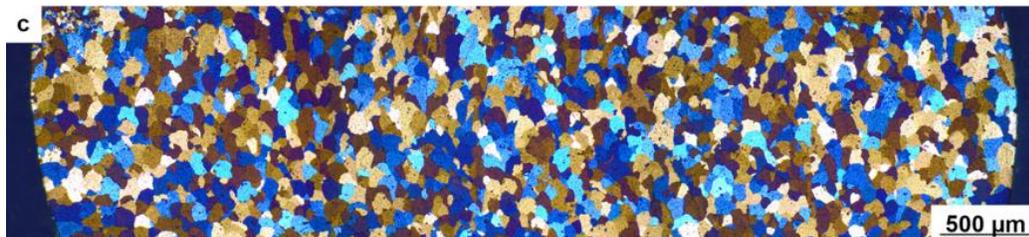

Results on structural materials & system design

Wire Arc Additive Manufacturing

(Al alloy MA-5183)

- 20% increase in yield strength and slight increase in ductility at 77K
- Equiaxed grain morphology – Low porosity

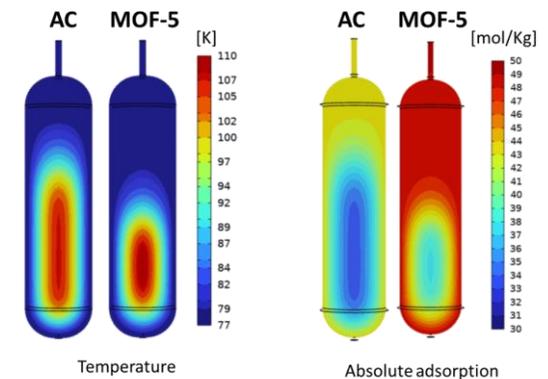

- 2 commercial Coatings systems validated for 77K

Design of vessel & balance of plant

- CFD model for MOF and ACs adsorption (COMSOL Multiphysics)

- Numerical simulations for refilling cold ads. H₂

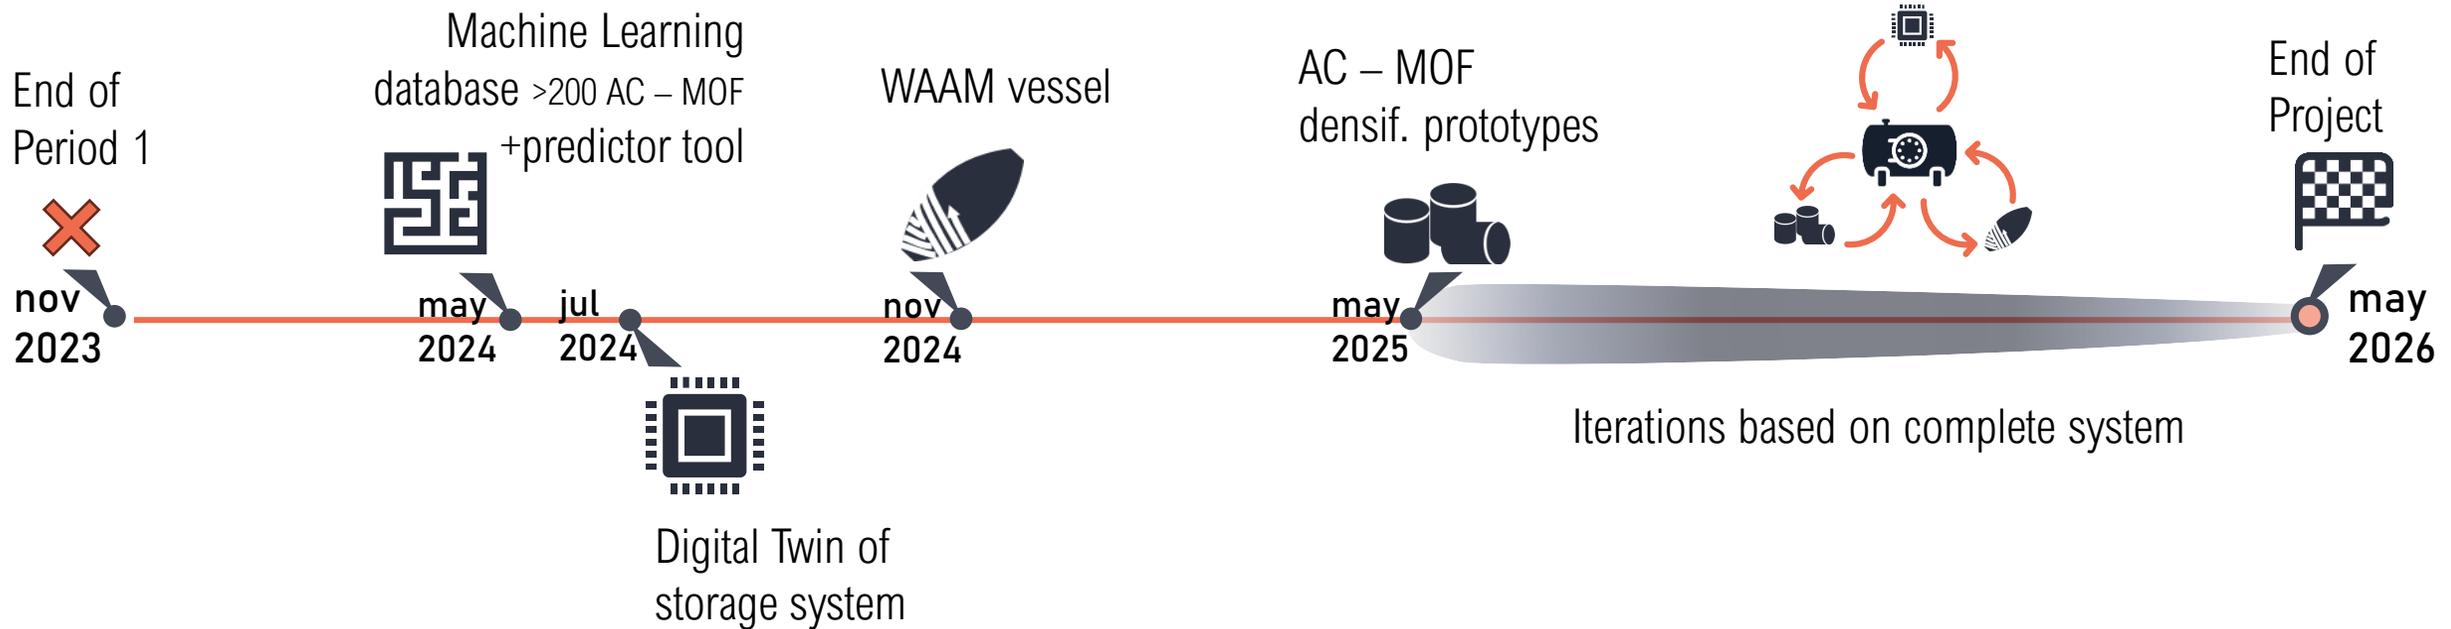

- 3D design & instrumentation

ONGOING

Timeline of Milestones

3. Technical Challenges Encountered During Project Execution

- Main technical challenges

Main technical challenges

Bottlenecks

- H₂ uptake tests (>>100 samples)
- Material aging under cycling (thermal/loads stress)
- Feeding the ML database for consistent predictions

Missing capacities

- Mechanical testing @H₂ @77K
- Risk assessment (burst testing)
- No skills on complete storage systems (OEM missing)

Standardisation / Harmonisation

- MOF inputs/outputs for ML
- Data gaps in existing literature (few studies @100 bar / no data @160 K)
- Final 3D design of vessel – Operational parameters?

“Maturing the production standards of ultraporous structures for high density hydrogen storage bank operating on swinging temperatures and low compression”
